

PRESENTATION OF OUR LIFTING TECHNOLOGY / INDUSTRIAL RELOCATION DEPARTMENT

Lifting technology encompasses all processes involved in lifting, moving and positioning loads, whether goods, equipment, containers or heavy packages, using mechanical or manual means. On site, this includes, in particular, handling during the loading and unloading of vehicles, the use of lifting equipment (cranes, forklifts, hoists, lifting platforms) and the preparation, slinging and securing of loads prior to transport.

As this work requires care and expertise, compliance with safety regulations is at the heart of every operation. This enables us to avoid risks and ensure a controlled process.

Successful lifting always begins with good preparation

The success of a lifting or transport operation is no coincidence: it is based on a thorough analysis of the site, a precise understanding of the constraints and the definition of a clear, safe and realistic scenario. That is why Bergen SA offers you a free technical assessment. This is carried out directly on site by our specialists and enables us to identify the solutions best suited to your needs and to prepare a detailed quotation based on concrete facts.

An on-site assessment

As part of this service, our team will visit your premises to assess the actual configuration of your working environment. We carefully analyze access points, maneuvering areas, sensitive areas, obstacles and existing equipment to gain a complete picture of the situation - without making any assumptions. This enables us to create a reliable working framework right from the start. This first step allows us to identify critical points and check the feasibility of the planned measures. We take your on-site requirements into account and select a safe, practical lifting and transport method that suits the circumstances.

Tailor-made preparation

After the visit, you will receive a structured and comprehensive document with a detailed deployment scenario and a tailor-made transport plan. This preparation helps to organize the deployment effectively, minimize last-minute changes and avoid surprises. It also facilitates cooperation, as all parties involved have a clear framework.

In addition to the technical assessment, our team supports you with a focused look at safety and optimization. We provide recommendations to improve the organization of the areas of operation, secure processes and reduce risks due to insufficiently considered restrictions. Better control in advance not only reduces risk, but also contributes to better control of indirect costs.

Request your free technical assessment

Are you planning a lifting or transport operation? Let our experts analyze your situation free of charge and receive a detailed quote based on thorough preparation and tailored to your actual circumstances on site. This offer is part of our commitment to supporting our customers in preparing for, analyzing and overcoming constraints. With a comprehensive technical assessment, we help you create a clear, realistic and safe framework so that you can approach your lifting and transport work with greater peace of mind. Because a well-prepared project is a better-controlled project - as always, «between you and me».

New in Geneva!

We are opening a branch specializing in industrial removals to better support our customers in the region with local and specialized teams.
